

Hi,

I would like to request some improvements to the page `import_edit2.php` and to the Excel import process.

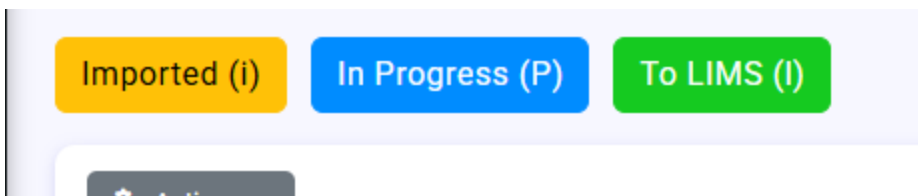

1) Main page of import: `import_edit2.php`

As you can see, at the top of the page there are three buttons:

- **Imported**
- **In Progress**
- **To LIMS**

I would like these sections to work better.

At the moment, the page shows the data coming directly from the Excel import.

A. Imported

When clicking **Imported**, I would like the page to show **all records in the database with status = "imported"** for the specific user (`user_id`), but with the possibility to also view records from all other users.

In this view, the user should be able to:

- insert/edit data
- modify records
- send records to LIMS
- remove lines

B. In Progress

This section is **not necessary**, so you can remove it.

C. To LIMS

When clicking **To LIMS**, it should show **only the records with status = "TO LIMS"** (already sent).

In this case:

- show data in **read-only mode**
- **no editing**
- **no export/send to LIMS**

General note

I think it may be better **not to keep all these functionalities on the same page**, because the page is already very large and I am worried it could become too slow.

Please suggest the **best technical solution**.

At the same time, if we make any modification to the main page, **the same changes should also be applied to the historical data page**.

2) XLS Import

At the moment, I tested importing around **15–20 rows** from Excel.

What happens if I import **30 or 40 rows**?

The page becomes very slow.

Please suggest and implement a solution to improve performance for larger Excel imports.

3) Performance optimization

If you see any possible improvements or optimizations in `import_edit2.php` to make it faster, please go ahead and implement them.
